

Learned-Transition Simulator: MDP Formulation and Initial Results

William Dennis

June 2026

Status

Placeholder. Learned transition models (calibrated from real wearable data) replace the hand-specified rule-based transition matrix with data-driven dynamics. This specification will be filled in when learned transitions are implemented.

Current framework support:

- `config/learned.yaml` — schema-reference mode config stub
- `src/rl_health_interventions/transitions/` — ABC ready for new registration
